4.11 Flow Models

- $\bullet \quad Maximum/Minimum flow with lower bound/Circulation problem\\$
 - 1. Construct supersource S and sink T.
 - 2. For each edge (x,y,l,u), connect $x \to y$ with capacity u-l.
 - 3. For each vertex v, denote by in(v) the difference between the sum of incoming lower bounds and the sum of outgoing lower bounds.
 - 4. If in(v) > 0, connect $S \to v$ with capacity in(v), otherwise, connect $v \to T$ with capacity -in(v).
 - To maximize, connect $t \to s$ with capacity ∞ (skip this in circulation problem), and let f be the maximum flow from S to T. If $f \neq \sum_{v \in V, in(v) > 0} in(v)$, there's no solution. Otherwise, the maximum flow from s to t is the answer.
 - To minimize, let f be the maximum flow from S to T. Connect $t \to s$ with capacity ∞ and let the flow from S to T be f'. If $f+f' \neq \sum_{v \in V, in(v)>0} in(v)$, there's no solution. Otherwise, f' is the answer.
 - 5. The solution of each edge e is $l_e + f_e$, where f_e corresponds to the flow of edge e on the graph.
- Construct minimum vertex coverfrom maximum matching M on bipartite $\operatorname{graph}(X,Y)$
 - 1. Redirect every edge: $y \to x$ if $(x,y) \in M, x \to y$ otherwise.
 - 2. DFS from unmatched vertices in X.
 - 3. $x \in X$ is chosen iff x is unvisited.
 - 4. $y \in Y$ is chosen iff y is visited.
- Minimum cost cyclic flow
 - 1. Consruct supersource S and $\sinh T$
 - 2. For each edge (x, y, c), connect $x \to y$ with (cost, cap) = (c, 1) if c > 0, otherwise connect $y \to x$ with (cost, cap) = (-c, 1)
 - 3. For each edge with c<0, sum these cost as K, then increase d(y) by 1, decrease d(x) by 1

- 4. For each vertex v with d(v) > 0, connect $S \rightarrow v$ with (cost, cap) = (0, d(v))
- 5. For each vertex v with d(v) < 0, connect $v \rightarrow T$ with (cost, cap) = (0, -d(v))
- 6. Flow from S to T, the answer is the cost of the flow C+K
- Maximum density induced subgraph
- 1. Binary search on answer, suppose we're checking answer T
- $2. \ \ {\it Constructa\, max\, flow\, model}, {\it let}\, K\, {\it be\, the \, sum\, of \, all\, weights}$
- 3. Connect source $s \to v, v \in G$ with capacity K
- 4. For each edge (u, v, w) in G, connect $u \to v$ and $v \to u$ with capacity w
- 5. For $v \in G$, connect it with sink $v \to t$ with capacity $K+2T-(\sum_{e \in E(v)} w(e))-2w(v)$
- 6. T is a valid answer if the maximum flow f < K|V|
- Minimum weight edge cover
 - 1. For each $v \in V$ create a copy v', and connect $u' \to v'$ with weight w(u,v).
 - 2. Connect $v \rightarrow v'$ with weight $2\mu(v)$, where $\mu(v)$ is the cost of the cheapest edge incident to v.
 - 3. Find the minimum weight perfect matching on G'.
- Project selection problem
 - 1. If $p_v > 0$, create edge (s, v) with capacity p_v ; otherwise, create edge (v, t) with capacity $-p_v$.
 - 2. Create edge (u,v) with capacity w with w being the cost of choosing u without choosing v.
 - $3. \ \ The {\it mincut} is equivalent to the {\it maximum} profit of a subset of projects.$
- Dual of minimum cost maximum flow
 - 1. Capacity c_{uv} , Flow f_{uv} , Cost w_{uv} , Required Flow difference for vertex b_u .
 - 2. If all w_{uv} are integers, then optimal solution can happen when all p_u are integers.

$$\min \sum_{uv} w_{uv} f_{uv}$$

$$-f_{uv} \ge -c_{uv} \Leftrightarrow \min \sum_{u} b_{u} p_{u} + \sum_{uv} c_{uv} \max(0, p_{v} - p_{u} - w_{uv})$$

$$\sum_{v} f_{vu} - \sum_{v} f_{uv} = -b_{u}$$

$$p_{u} \ge 0$$

6.14.1 Construction

Primal	Dual
Maximize $c^{T}x$ s.t. $Ax \leq b, x \geq 0$	Minimize $b^{T}y$ s.t. $A^{T}y \ge c, y \ge 0$
Maximize $c^{T}x$ s.t. $Ax \leq b$	Minimize $b^{T}y$ s.t. $A^{T}y = c, y \ge 0$
Maximize $c^{T}x$ s.t. $Ax = b, x \ge 0$	Minimize $b^{T}y$ s.t. $A^{T}y \ge c$

 $\overline{\mathbf{x}}$ and $\overline{\mathbf{y}}$ are optimalified only if for all $i \in [1, n]$, either $\overline{x}_i = 0$ or $\sum_{j=1}^m A_{ji} \overline{y}_j = c_i$ holds and for all $i \in [1,m]$ either $\bar{y}_i = 0$ or $\sum_{j=1}^n A_{ij} \bar{x}_j = b_j$ holds.

1. In case of minimization, let $c'_i = -c_i$

- 2. $\sum_{1 \le i \le n} A_{ji} x_i \ge b_j \to \sum_{1 \le i \le n} -A_{ji} x_i \le -b_j$
- 3. $\sum_{1 \le i \le n} A_{ji} x_i = b_j$ $\sum_{1 \le i \le n} A_{ji} x_i \le b_j$
 - $\bullet \quad \sum_{1 \le i \le n}^{-} A_{ji} x_i \ge b_j$
- 4. If x_i has no lower bound, replace x_i with $x_i x_i'$

Theorem

```
Lucas's Theorem
```

For non-negative integer n, m and prime P, $C(m,n) \operatorname{mod} P = C(m/M,n/M) * C(m\%M,n\%M) \operatorname{mod} P$ = mult_i(C(m_i,n_i)) $where \verb|m_i| is the i-th digit of \verb|m| in base P.$

Kirchhoff's theorem

 $A_{\{ii\}} = deg(i), A_{\{ij\}} = (i,j) \in ?-1:0$ Deleting any one row, one column, and calthedet(A)

$Nth\,Catalan\,recursive\,function:$

```
C_0=1, C_{n+1}=C_n*2(2n+1)/(n+2)
```

```
Mobius Formula
u(n)=1, if n=1

6.23 General Purpose Numbers

• Bernoulli numbers
$$B_0 - 1, B_1^{\pm} = \pm \frac{1}{2}, B_2 = \frac{1}{6}, B_3 = 0$$

$$\sum_{j=0}^{m} {m+1 \choose j} B_j = 0, \text{EGF is } B(x) = \frac{x}{e^x - 1} = \sum_{n=0}^{\infty} B_n \frac{x^n}{n!}.$$

$$S_m(n) = \sum_{k=1}^{n} k^m = \frac{1}{m+1} \sum_{k=0}^{m} {m+1 \choose k} B_k^+ n^{m+1-k}$$
Strike the first first of the limit Positive of the limit Po

• Stirling numbers of the second kind Partitions of n distinct elements into

exactly kilothes.
$$S(n,k) = S(n-1,k-1) + kS(n-1,k), S(n,1) = S(n,n) = 1$$

$$S(n,k) = \frac{1}{k!} \sum_{i=0}^{k} (-1)^{k-i} {k \choose i} i^n$$

$$x^n = \sum_{i=0}^{n} S(n,i)(x)_i$$
 • Pentagonal number theorem

$$x^{k} = \sum_{i=0}^{k} S(n,i)(x)_{i}$$
• Pentagonal number theorem
$$\prod_{n=1}^{\infty} (1-x^{n}) = 1 + \sum_{k=1}^{\infty} (-1)^{k} \left(x^{k(3k+1)/2} + x^{k(3k-1)/2} \right)$$
• Catalan numbers
$$C_{n}^{(k)} = \frac{1}{(k-1)n+1} {kn \choose n}$$

$$C^{(k)}(x) = 1 + x[C^{(k)}(x)]^{k}$$

$$C_n^{(k)} = \frac{1}{(k-1)n+1} {kn \choose n}$$
$$C^{(k)}(x) = 1 + x[C^{(k)}(x)]^k$$

Eulerian numbers

Number of permutations $\pi \in S_n$ in which exactly k elements are greater than the previous element. kj:ss.t. $\pi(j) > \pi(j+1), k+1j$:ss.t. $\pi(j) \ge j$, kj:ss.t. $\pi(j) > j$.

E(n,k) = (n-k)E(n-1,k-1) + (k+1)E(n-1,k)E(n,0) = E(n,n-1) = 1 $E(n,k) = \sum_{j=0}^{k} (-1)^{j} {n+1 \choose j} (k+1-j)^{n}$

6.24 Tips for Generating Functions

• Ordinary Generating Function $A(x) = \sum_{i>0} a_i x^i$

```
-A(rx) \Rightarrow r^n a_n
-A(x)+B(x) \Rightarrow a_n+b_n
-A(x)B(x)\Rightarrow\Sigma_{i=0}^n a_i b_{n-i}
- A(x)^{k} \Rightarrow \sum_{i_{1}+i_{2}+\cdots+i_{k}=n} a_{i_{1}} a_{i_{2}} \dots a_{i_{k}}
-xA(x)' \Rightarrow na_n
-\frac{A(x)}{1-x} \Rightarrow \sum_{i=0}^{n} a_i
```

• Exponential Generating Function $A(x) = \sum_{i>0} \frac{a_i}{i!} x_i$

```
-A(x)+B(x) \Rightarrow a_n+b_n
-A^{(k)}(x) \Rightarrow a_{n+k}
-A(x)B(x) \Rightarrow \sum_{i=0}^{n} {n \choose i} a_i b_{n-i}
-A(x)^k \Rightarrow \sum_{i_1+i_2+\dots+i_k=n} \binom{n}{i_1,i_2,\dots,i_k} a_{i_1} a_{i_2} \dots a_{i_k}
```

• Special Generating Function $- (1+x)^n = \sum_{i \ge 0} {n \choose i} x^i$

 $-xA(x) \Rightarrow na_n$

$- \frac{1}{(1-x)^n} = \sum_{i\geq 0} \binom{i}{n-1} x^i$ Polynomial

            Additional Mo's Algorithm Trick
  • Mo's Algorithm With Addition Only
       - \ \ Sort querys same as the normal Mo's algorithm.
       - For each query [l,r]:
       - If l/blk = r/blk, brute-force.
       - If l/blk \neq curL/blk, initialize curL := (l/blk + 1) \cdot blk, curR :=
           curL-1
       - If r > curR, increase curR
       - decrease curL to fit l, and then undo after answering
  • Mo's Algorithm With Offline Second Time
       - \ \operatorname{Require} : \operatorname{Changing} \operatorname{answer} \equiv \operatorname{adding} f([l,r],r+1).
       - Require: f([l,r],r+1) = f([1,r],r+1) - f([1,l),r+1).
- Part1: Answer all f([1,r],r+1) first.
           Part2: Store curR \to R for curL (reduce the space to O(N)), and then
           answer them \, by \, the \, second \, off line \, algorithm.
                   You must do the above symmetrically for the left boundaries.
