1.3 readchar [5f169e]

1.5 Black Magic [b0ba22]

GNU extensions: mt19937; pb_ds red-black tree with find_by_order/order_of_key $O(\log n)$; mergeable heap join; persistent rope. Snippet, not compilable as-is.

```

1.6 Pragma Optimization [e4ae92]

Aggressive optimisation and SIMD targets; last line flushes denormals to zero. SIGILL on judges lacking these instruction sets.

```
#pragma GCC optimize("Ofast

#else

```

1.7 Bitset [9d3114]

std::bitset API reference. Note: reset() clears to 0 and set() fills with 1 — the comments in the listing are swapped.

```
#include<bits/stdc++.h>
using namespace std;
#ifdef BITSET_NO_MAIN
int main () {

    bit.count();

2.2 Bridge* [e040b0]

2.3 SCC* [3e1afd]

3 Data Structure

3.1 Discrete Trick

Binary-search helpers for an already sorted value list. Coordinate compression (sort+unique) is intentionally omitted; “index of x” uses lower_bound, while the count / first 1-based position after values $\leq x$ uses upper_bound.

```
#include <algorithm>
#include <vector>
using namespace std;

// The caller supplies an
// already sorted list. No sort/unique is performed.
int index_of(
    const vector<int> &val, int x) { return lower_bound
        (val.begin(), val.end(), x) - val.begin(); }
int count_le(
    const vector<int> &val, int x) { return upper_bound
        (val.begin(), val.end(), x) - val.begin(); }
int count_lt(
    const vector<int> &val, int x) { return lower_bound
        (val.begin(), val.end(), x) - val.begin(); }
```

3.2 BIT kth* [0002d9]

k-th smallest from a value-domain BIT in $O(\log N)$ by descending the tree. *N must be a power of two.*

```
int bit[N + 1]; // N = 2 ^ k
int query_kth(int k) {
    int res = 0;
    for (int i = N; i >>= 1; )
        if (bit[res + i] < k)
            k -= bit[res + i];
    return res + 1;
}
```

3.3 Interval Container* [69c9e6]

Maintains disjoint half-open $[L, R)$ intervals with auto-merge; amortised $O(\log n)$.

Mergeable *max*-heap, merge/pop $O(\log n)$, keep subtree size and sum. No lazy tags.

4.10 Flow Models

- Maximum/Minimum flow with lower bound / Circulation problem
 - Construct super source S , sink T .
 - Edge (x, y, l, u) : connect $x \rightarrow y$ with cap $u - l$.
 - $in(v)$: sum of incoming lower bounds minus sum of outgoing ones.
 - $in(v) > 0$: connect $S \rightarrow v$ with cap $in(v)$; else $v \rightarrow T$ with cap $-in(v)$.
 - Max: connect $t \rightarrow s$ with cap ∞ (skip for circulation), $f := \text{maxflow } S \rightarrow T$. No solution if $f \neq \sum_{in(v)>0} in(v)$; else maxflow $s \rightarrow t$ is the answer.
 - Min: $f := \text{maxflow } S \rightarrow T$; connect $t \rightarrow s$ with cap ∞ , $f' := \text{flow } S \rightarrow T$. No solution if $f + f' \neq \sum_{in(v)>0} in(v)$; else f' .
- Each edge e has solution $l_e + f_e$, f_e its flow.
- Construct minimum vertex cover from maximum matching M on bipartite graph (X, Y)
 - Redirect: $y \rightarrow x$ if $(x, y) \in M$, else $x \rightarrow y$.
 - DFS from unmatched vertices in X .
 - Choose $x \in X$ iff unvisited; $y \in Y$ iff visited.
- Minimum cost cyclic flow
 - Construct super source S , sink T .
 - Edge (x, y, c) : if $c > 0$ connect $x \rightarrow y$ with $(cost, cap) = (c, 1)$, else $y \rightarrow x$ with $(-c, 1)$.

- For $c < 0$ edges, sum cost as K , then $d(y)++$, $d(x)--$.
- $d(v) > 0$: connect $S \rightarrow v$ with $(0, d(v))$; $d(v) < 0$: $v \rightarrow T$ with $(0, -d(v))$.
- Flow $S \rightarrow T$; answer is the flow cost $C + K$.
- Maximum density induced subgraph
 - Binary search the answer T ; let K be the sum of all weights.
 - Connect $s \rightarrow v, v \in G$, with cap K .
 - Edge (u, v, w) : connect both ways with cap w .
 - Connect $v \rightarrow t$ with cap $K + 2T - (\sum_{e \in E(v)} w(e)) - 2w(v)$.
 - T is valid if maxflow $f < K|V|$.
- Minimum weight edge cover
 - Copy each $v \in V$ as v' ; connect $u' \rightarrow v'$ with weight $w(u, v)$.
 - Connect $v \rightarrow v'$ with weight $2\mu(v)$, $\mu(v) := \text{cheapest edge at } v$.
 - Min weight perfect matching on G' .
- Project selection problem
 - $p_v > 0$: edge (s, v) cap p_v ; else (v, t) cap $-p_v$.
 - Edge (u, v) cap $w := \text{cost of choosing } u \text{ without } v$.
 - The mincut equals the max profit over subsets of projects.
- Dual of minimum cost maximum flow
 - Cap c_{uv} , flow f_{uv} , cost w_{uv} , required flow difference b_u .
 - If all w_{uv} are integers, an optimum with all p_u integral exists.

$$\min_{uv} \sum w_{uv} f_{uv} - f_{uv} \geq -c_{uv} \Leftrightarrow \min_u \sum b_u p_u + \sum_{uv} c_{uv} \max(0, p_v - p_u - w_{uv})$$

$$\sum_v f_{vu} - \sum_v f_{uv} = -b_u \quad p_u \geq 0$$

7.5 Newton's Method

Given $F(x)$ where

$$F(x) = \sum_{i=0}^{\infty} \alpha_i (x - \beta)^i$$

for β being some constant. Polynomial P such that $F(P) = 0$ can be found iteratively. Denote by Q_k the polynomials such that $F(Q_k) = 0 \pmod{x^{2^k}}$, then

$$Q_{k+1} = Q_k - \frac{F(Q_k)}{F'(Q_k)} \pmod{x^{2^{k+1}}}$$

9.2 Mo's Algorithm(With modification)

[1081a0]

Mo's with point updates, block $N^{2/3}$, $O(N^{5/3})$. The callback-based solve applies/rolls back updates and reports each query.

```

/*
Mo's algorithm with point updates.
'add_time(t, L, R)' applies
    update t, 'sub_time' rolls it back, and the other
callbacks maintain the
    current [L,R] answer. Updates are numbered from 1.

9.3 Mo's Algorithm On Tree [9117ae]

Path queries via the Euler bracket sequence, $O(N\sqrt{N})$; the callback-based constructor takes the caller's LCA and solve handles the extra LCA vertex.

```

/*
Mo's algorithm on tree paths
. 'in'/'out' are the entry/exit positions in a
2n Euler tour
and 'ord' maps Euler positions back to vertices.

        if (q.lca != -1) flip(q.lca);
    }
}

9.4 Additional Mo's Algorithm Trick

- Mo's Algorithm With Addition Only
 - Sort queries same as the normal Mo's algorithm.
 - For each query $[l, r]$:
 - If $l/blk = r/blk$, brute-force.
 - If $l/blk \neq r/blk$, initialize $curL := (l/blk + 1) \cdot blk$, $curR := curL - 1$
 - If $r > curR$, increase $curR$
 - decrease $curL$ to fit l , and then undo after answering
- Mo's Algorithm With Offline Second Time
 - Require: Changing answer $\equiv$ adding $f(l, r, r+1)$.
 - Require: $f(l, r, r+1) = f(l, r, r+1) - f(l, l, r+1)$.
 - Part1: Answer all $f(l, r, r+1)$ first.
 - Part2: Store $curR \rightarrow R$ for $curL$ (reduce the space to $O(N)$), and then answer them by the second offline algorithm.
 - Note: You must do the above symmetrically for the left boundaries.

9.5 Hilbert Curve [190152]

Hilbert index of (x, y) in $O(\log n)$, $n = 2^k$. Use it to order Mo's queries instead of block sorting.

```

ll hilbert(int n, int x, int y) {
    ll res = 0;
    for (int s = n / 2; s; s >>= 1) {
        int rx = (x & s) > 0, ry = (y & s) > 0;
        res += s * 111 * s * ((3 * rx) ^ ry);
        if (!ry) {
            if (rx) x = s - 1 - x, y = s - 1 - y;
            swap(x, y);
        }
    }
    return res;
} // n = 2^k
